

City of Holmes Beach
QUESTIONNAIRE FOR FLOOD MANAGEMENT PLAN INPUT:

Site Address: _____

1) Is flooding due to tides/tidal surge, runoff of rainwater, wind-driven flooding”?

2) We wish to identify the main areas where flooding problems occur. To what extent the flooding is “street ponding” and to what extent the flooding results in damages to buildings (businesses or homes).

3) We wish to discuss initial thoughts as to how to solve flooding problems. For example, greater limitation as to impervious surfaces; purchase of property for retention ponds; swales in rights-of-way; regulations to require greater retention on site; use of technical solutions such as “flapper valves” or “duckbill valves”, channeling roof runoff by gutter or ground control; French drains (discharge below the surface), etc.

We are particularly interested in receiving input from areas having historically experienced flooding problems. Tell us the extent to which you have experienced flooding on your property and particularly if you have experienced water inside your homes or businesses and whether or not flooding was severe.
